14th Workshop on Imported Infectious Diseases

2013

27th – 28th September
Bordeaux

Bordeaux 2013 - 14th TropNet Workshop

Friday, 27/09/2012		
13 ⁰⁰ -13 ³⁰	Welcome and Introduction	Philippe Vigouroux, Director General (UHC) Denis Malvy & Matthieu Mechain, Bordeaux
13 ³⁰ -15 ⁰⁰	Report of steering committee and coordinator <ul style="list-style-type: none"> • European networks in Tropical and Travel Medicine: experience of collaboration and strengthening the network • TropNet membership issues • Overview on the 'TropNet platforms' including <ul style="list-style-type: none"> ▪ Research platform <ul style="list-style-type: none"> - Report on ongoing TropNet studies & studies with participation of TropNet centres - Forecast on upcoming TropNet studies ▪ TropNet figures on imported diseases in 2012 ▪ Update on muscular sarcocystosis imported from Tioman Island 2011 & 2012 	Christoph Hatz & Andreas Neumayr, Basel
15 ⁰⁰ -15 ³⁰	Break	
15 ³⁰ -17 ⁰⁰	<ul style="list-style-type: none"> • TropNet website: using the FORUM • Network resources: sources for orphan drugs • Development of TropNet travel medicine info material • Discussion on network activities/projects: what? how? who? 	Andreas Neumayr, Basel Christoph Hatz, Basel
17 ⁰⁰ -17 ³⁰	Break	
17 ³⁰ -19 ⁰⁰	Malaria: <ul style="list-style-type: none"> • PANDA and the pitting debt <ul style="list-style-type: none"> • HaemoArt: Haemolysis after antimalarial treatment with artemisinins • Eurartesim: Study on treatment of <i>P. vivax</i> malaria Cutaneous leishmaniasis: LeishMan: Surveillance of imported leishmaniasis with regard to diagnostic & therapeutic procedures Research projects in a European context: discussion on perspectives of efficient joint research projects	S. Jaureguiberry, Paris Andreas Neumayr, Basel Christoph Hatz, Basel Andreas Neumayr, Basel Matthieu Mechain, Bordeaux
19 ⁰⁰ -19 ³⁰	Transport to City Hall	Matthieu Mechain, Bordeaux
19 ³⁰ -20 ⁴⁵	City Hall with reception (cocktail pre-dinner)	Josy Reiffers, on behalf of Alain Juppé, Mayor of Bordeaux Christoph Hatz, Basel
20 ⁴⁵ -21 ⁰⁰	Transport to Dinner	Denis Malvy, Bordeaux
21 ¹⁵ -23 ⁰⁰	Dinner	
Saturday, 28/09/2012		
9 ⁰⁰ -9 ¹⁵	Introduction	Coordinator, SC members
9 ¹⁵ -10 ³⁰	Project proposal: First- and second-line treatment of giardiasis Project proposal: Retrospective analysis of life vaccinations given to travelers with immunosuppressive therapy Project Proposal: Sentinel surveillance of artemisinin resistance in returning travellers with <i>P. falciparum</i> malaria	Andreas Neumayr, Basel Silja Buehler, Zürich Andreas Neumayr, Basel
10 ³⁰ -11 ⁰⁰	Break	
11 ⁰⁰ -12 ³⁰	Drug resistant bacteria <ul style="list-style-type: none"> • ESBL carriage in travelers: data from Basel, Switzerland • ESBL carriage in travelers: data from Leiden, the Netherlands • Colonization with resistant intestinal bacteria: a study on risk factors in Finnish travelers New multiplex qPCR method for assessment of intestinal pathogens in returning travelers	Esther Kuenzli, Basel Leo Visser, Leiden Anu Kanele, Helsinki Anu Kantele, Helsinki
12 ³⁰ -13 ³⁰	Lunch	
13 ³⁰ -14 ⁴⁵	<ul style="list-style-type: none"> • The new Italian malaria prophylaxis recommendations 2013 • The new British malaria prophylaxis recommendations 2013 • Autoimmune travelers in the travel clinic: are they different? • Just published: Neurological complications of dengue 	Guido Calleri, Torino & Andrea Angheben, Negrar (Verona) Matthias Schmid, Newcastle upon Tyne Silja Buehler, Zürich Joaquim Gascon, Barcelona
14 ⁴⁵ -16 ³⁰	Clinical case presentations <ul style="list-style-type: none"> • Breast calcifications in an immigrant from Mali ? • A myxoid muscle tumor with a Russian surprise ? • Malaria ? • A family outbreak of arthritis after a beach holiday in Bali & 'same same but different' • Migrating inflammation in travellers to Thailand • Veterinary ivermectin - a heroic remedy? 	Michel Develoux, Paris Leo Visser, Leiden Åase Berg, Stavanger Leo Visser, Leiden Andreas Neumayr, Basel Anu Kantele, Helsinki Leo Visser, Leiden
16 ³⁰ -16 ⁴⁵	Farewell	Denis Malvy, Bordeaux
17 ⁰⁰ -18 ⁴⁵	Eurartesim: Vivax Malaria Treatment Study - Investigator Meeting	Nicola Gargano, Sigma Tau

TropNet Workshop – Bordeaux 2013

Participants

Jan Clerinx, Antwerp, Belgium

Anu Kantele, Helsinki, Finland

Denis Malvy, Bordeaux, France

Matthieu Mechain, Bordeaux, France

Michel Develoux, Paris, France

Stéphane Jaureguiberry, Paris, France

Insa Joost, Freiburg, Germany

Jakob Cramer, Hamburg, Germany

Matthias Schmid, Newcastle upon Tyne, Great Britain

Silvia Odolini, Brescia, Italy

Andrea Angheben, Negrar, Italy

Piero Ghirga, Roma, Italy

Guido Calleri, Torino, Italy

Emile Jonker, Leiden, Netherlands

Leo Visser, Leiden, Netherlands

Kristine Mörch, Bergen, Norway

Aase Berg, Stavanger, Norway

Jorge Seixas, Lisbon, Portugal

Joaquim Gascon, Barcelona, Spain

Israel Molina, Barcelona, Spain

Toni Soriano Arandes, Barcelona, Spain

Christoph Hatz, Basel, Switzerland

Andreas Neumayr, Basel, Switzerland

Valérie D'Acremont, Lausanne, Switzerland

Silja Buehler, Zürich, Switzerland

Esther Kuenzli, Basel, Switzerland

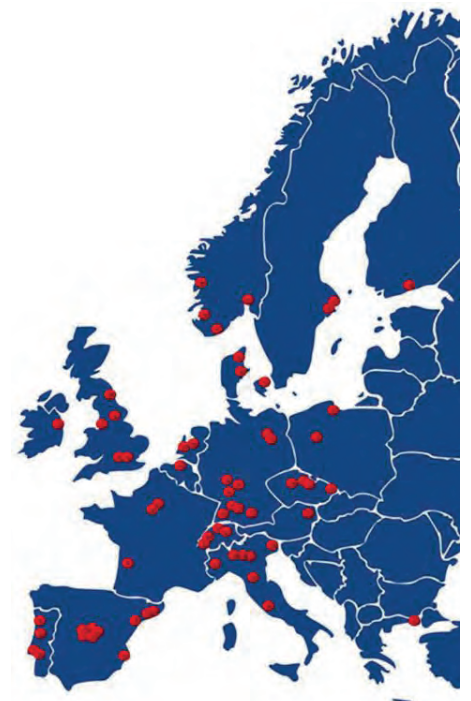

Welcome to the 14th Workshop on Imported Infectious Diseases

27th – 28th Sept. 2013

Report of the steering committee & coordinator

- Membership issues
- The TropNet platforms: where are we?
- The 2012 figures on imported diseases
- TropNet website: update & crash course
- Implementation of joint network research projects

Membership issues

- currently **71** member sites
- **2012/2013:**
+ 3 sites

Research

- Coordination & support for individual research groups working on communicable & non-communicable diseases:
 - Treatment of severe malaria
 - Dengue/Chikungunya
 - Leishmaniasis
 - MRSA in travellers
 - Haemolysis & Artemisinines
 - Giardia treatment
 - ...

Policy development

- Harmonisation of European recommendation & guidelines to establish & provide:
 - evidence-based travel advice
 - standards in post-travel diagn. & therapeutic procedures of imported infectious diseases
- Interaction with national societies WHO, ECDC, FESTMIH, ENIVD, EuroTravNet, CDC

Teaching & Training

- Development of a curriculum / modules for a European ISTM-prep course
- Setup and coordination of "hands on" training within the network

Surveillance / reporting

- Network-internal yearly report on imported diseases
- Web-based communication platform to discuss:
 - emerging diseases
 - suspicious syndromes
 - discussion & follow-up unusual events / cases
- Collaboration with the CDC on Sarcocystis outbreak

Network resources

- Database / directory:
 - Site portraits (services, resources, research)
 - Sources & network stock-list of orphan drugs
 - Web-based communication platform ("FORUM")
- Downloadable information material for counselling travelers

Public

- Website:
 - Presentation of the background, partnerships & activities of the network
 - Updated surveillance news on global outbreak situation

7

Currently ongoing TropNet studies

→ **Artesunate for severe malaria in Europe**

→ **EU-FP7 DengueTools & TropNet study**

Sentinel surveillance of imported dengue in returning travelers: trends and virus evolution

→ **LeishMan working group**

Harmonization of clinical management & diagnostic methods for cutaneous & mucosal leishmaniasis in Europe

→ **Eurartesim®- Sigma Tau**

Pregnancy registry in Europe

9

TropNet study: Artesunate for severe malaria in Europe

Number of recruited patients: **160**

Dr. Thomas Zoller
MSc, DTM&H

EU-FP7 joint DengueTools & TropNet study:

Sentinel surveillance of imported dengue in returning travelers:
trends & virus evolution

Number of recruited patients: ~ **180**
(started Sept. 2011, running over 42 months)

11

LeishMan working group

Harmonization of clinical management & diagnostic methods
for cutaneous & mucosal leishmaniasis in Europe

*More details will
be presented later*

12

Safety & Pregnancy Registries Eurartesim®

- **Safety registry** (some TropNet Centres involved)

A European multi-centre study evaluating QTc prolongation with regard to co-morbidities and concomitant medications; monitoring patterns of drug utilization; treatment-assoc. adverse events

- **Pregnancy registry** (some TropNet Centres involved)

A European multi-centre pregnancy registry for patients exposed to Eurartesim® for the treatment of malaria whilst pregnant

13

Pregnancy Registry

Study objectives:

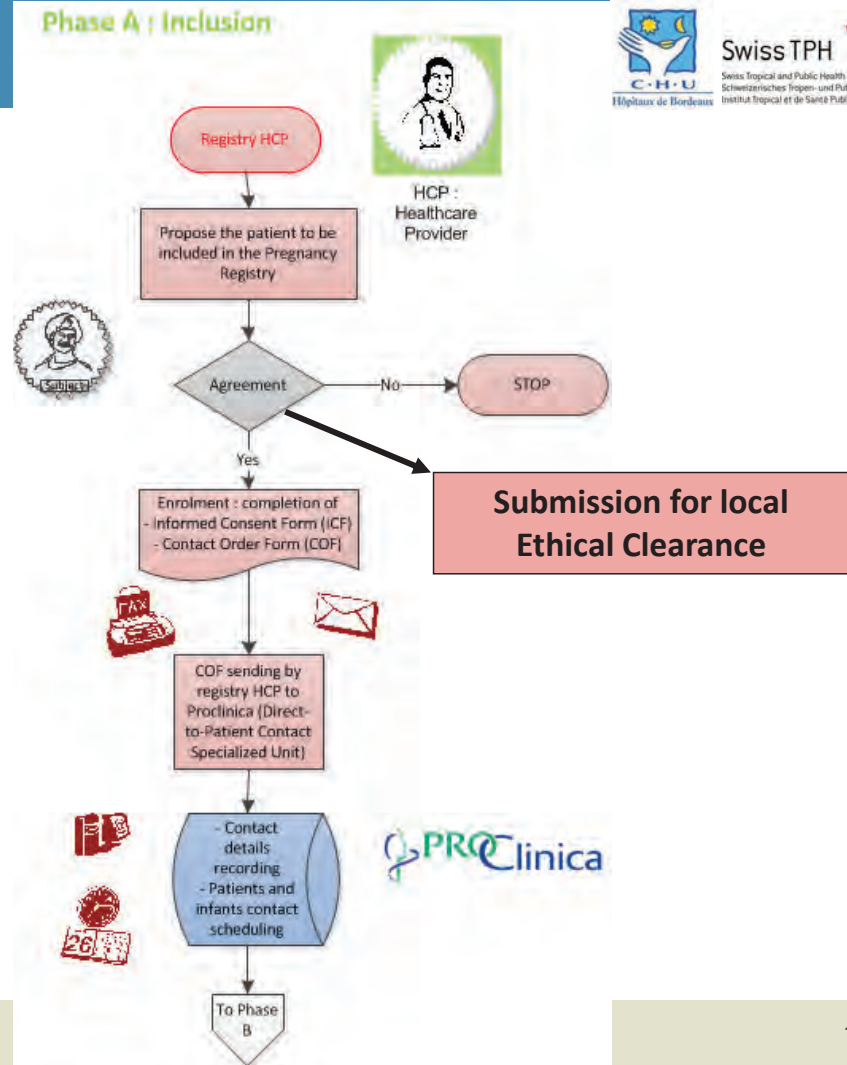

1. The primary objective is to assess the live birth incidence of minor and major congenital birth defects following exposure to Eurartesim® whilst pregnant or in the one month (30 days) prior to conception.
2. The secondary objective is to assess both maternal and fetal outcome following exposure to Eurartesim™ whilst pregnant or in the one month (30 days) prior to conception.

Activity	Expected Time
Set-up period	Nov 2011 – Aug 2012
Recruitment period	Sept/Oct 2012 - 2017
Follow-up period	2018 - 2019
Close out period	2019

14

Pregnancy registry

Patient Contact Process:

15

Current TropNet participation

→ StaphTrav - European network on imported *S. aureus*

Antibiotic resistance testing and molecular typing of imported *S. aureus* in returning travelers

→ REGISTRAT-MAPI Safety registry Eurartesim®

Treatment of uncomplicated malaria in returning travellers with Dihydroartemisinin/Piperaquine (France, Germany, Italy, Belgium, The Netherlands, Spain, UK)

16

New TropNet projects ahead

→ TropNet study HaemoART

Study on haemolysis under oral artemisinin therapy

→ TropNet/Sigma-Tau proof of concept study of Eurartesim[®] in patients with imported uncomplicated *P. vivax* malaria

→ TropNet studies GiardiaTreat & GiardiaREF

Tolerability of 5-nitroimidazole 1st-line regimens & RCT of 2nd-line regimens for refractory Giardiasis

17

Possible TropNet projects ahead

→ *Pharmacokinetic study on Praziquantel in schistosomiasis*

→ *TropNet study on PCR-based diagnosis of schistosomiasis in travellers*

→ *TropNet study on imported multiresistant intestinal bacteria*

→ *TropNet study on vaccinations in immunocompromised travelers*

→ *TropNet surveillance study on worldwide distribution of polymorphisms associated with artemisinin resistance of *P. falciparum* malaria*

⁴Public Health Department, Ministry of Health, Malaysia.

ABSTRACT

In October 2011, the National International Health Regulations (IHR) 2005 Focal Point for Malaysia received notification from the United States' Centers for Disease Control and Prevention (CDC) of a probable *Sarcocystis* outbreak amongst 23 travellers from six countries who had vacationed on Tioman Island between June and August 2011. The Ministry of Health, Malaysia (MOH) in collaboration with the Department of Veterinary Services, Malaysia (DVS) conducted a cross sectional study in November 2011 to determine the presence of *Sarcocystis* among humans, animals and in the environment in Tioman Island. Epidemiological investigations conducted involved a community health survey of 44 residents in Kampung Salang, Tioman and review of outpatient attendance cards for suspected or confirmed cases of *Sarcocystis*. Twenty-eight fresh stool samples were collected and sent to the National Public Health Laboratory (NPHL) for detection of *Sarcocystis* oocysts using fluorescence microscopy. Water samples taken from 27 water sampling points around the island were processed and analysed under the fluorescence microscope using ultraviolet (UV) light at the Institute for Medical Research (IMR) to detect the presence of *Sarcocystis* sporocyst. DVS collected 84 faecal samples from four types of domesticated animals and then analysed them at the Veterinary Services Centre in Tioman Island for *Sarcocystis* oocysts and other parasitic ova and cysts using qualitative Floatation Technique. The results showed that *Sarcocystis* was not present in humans, animals and in the environment in Tioman Island during the study period. Further surveillance among humans, wildlife and the environment is needed to determine *Sarcocystis* endemicity in Tioman Island.

30

Sequencing of the DNA from the tissue of the Dutch traveler identified *Sarcocystis nesbitti* as the causative organism

Short communication

Phylogenetic analysis of *Sarcocystis nesbitti* (Coccidia: Sarcocystidae) suggests a snake as its probable definitive host

ARTICLE INFO

Article history:
Received 3 February 2011
Received in revised form 10 July 2011
Accepted 18 July 2011

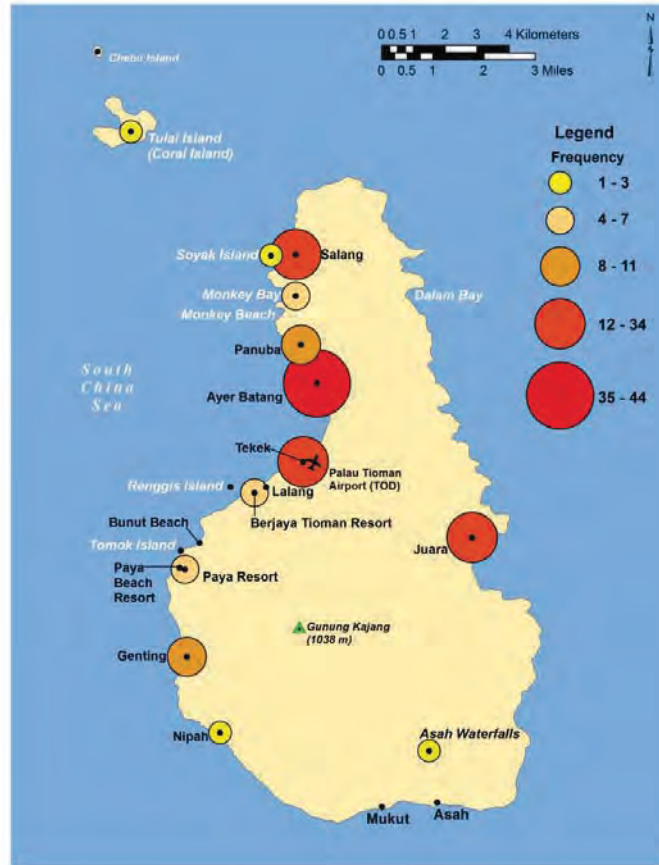

ABSTRACT

Sarcocystis nesbitti was first described by Mandour in 1969 from rhesus monkey muscle. Its definitive host remains unknown. 18S rRNA gene of *S. nesbitti* was amplified, sequenced, and subjected to phylogenetic analysis. Among those congeners available for comparison, it shares closest affinity with those species of *Sarcocystis* which use snakes as definitive hosts. We therefore hypothesize that a snake may serve as the definitive host for *S. nesbitti*.

The epidemic curve according to the week of departure from Tioman Island (n = 68 patients)

Development of TropNet travel medicine info material

The collage shows several overlapping cards for different travel-related conditions. The visible cards are:

- Paludisme** (Malaria)
- Rabies** (Rabies) - prevention & vaccination for travellers
- Malaria** (Malaria) - prevention
- Chikungunya Fieber** (Chikungunya fever)
- Bilharziose** (Schistosomiasis)
- Altitude Sickness** (Altitude sickness) - Prevention / Therapy
- Maladie de haute altitude** (High altitude disease) - Prévention et traitement
- Mal di montagna** (Mountain sickness) - Prevenzione / Terapia
- Höhenkrankheit** (High altitude sickness) - Verhütung / Therapie

Each card features the TropNet logo and the text: "European Network for Tropical Medicine and Travel Health".

Current flyer

The flyer is titled "Rabies Prevention & Vaccination". It includes the following sections:

- With the option to receive post-exposure vaccination, what is the benefit of pre-exposure vaccination for travellers?**
 - "Save time and spare your nerves"
 - The chance that a traveller is bitten, gets infected and dies of rabies is fortunately very low. However, the risk to sustain a bite or scratch caused by a potentially infected animal while travelling is often relatively high.
 - In most of these situations rabies treatment cannot be ruled out and post-exposure vaccination will be necessary if the problem is that there is no laboratory test which can be performed on the animal or that your best sample to rule out infection (The thousands of travellers receiving post-exposure vaccination every year) are not confirmed.
 - In many countries and regions of the world post-exposure vaccination is difficult to get and people immunization is frequently not available.
 - Prevention via exposure vaccination (especially animals) and exposure vaccination (especially in the frequently used and very expensive international air traffic).
 - Post-exposure vaccination of an international traveller (especially on a visit to local health facilities over 3 weeks, which most likely impacts travel plans).
 - Pre-exposure vaccination is considered to provide life-long immune memory in most people and can easily be "boosted" by 2 doses of spaced after exposure. There is also only demand 2 visits to local health facilities over 3 days. Therefore pre-exposure prophylaxis - even though expensive - might be a very reasonable investment during a traveller's life.
 - Improved quality of services: an unbroken chain is necessary to assure efficacy of the stored vaccine. This is then difficult to guarantee in remote regions of the world and in regions with frequent power cuts.
 - In some countries only older rabies vaccines (prepared from animal nervous tissue) are available. These vaccines - even though effective - have been replaced in the developed countries because of their side effect profile.
- Rabies**
 - Rabies is a viral disease transmitted via the saliva of infected domestic or wild mammals. With an estimated 50,000 to 100,000 people dying of rabies every year, rabies is a major problem in many developing countries (esp. in Asia and Africa), including industrialized travel destinations.
 - Humans are infected when they are bitten or scratched by infected animals, mostly dogs. They also enter mammals (in cats, monkeys, bats, raccoons, ferrets), note that they frequently are treated rabies although the virus does not penetrate the intact skin (e.g. when an animal licks exposed skin) humans can get infected when the saliva of an infected animal comes in contact with open, already healed, or contaminated wounds. After being scratched below the skin, the animal's claws (along the nails) and the spine can get into the brain, where it causes a severe and almost 100% fatal inflammation of the brain (encephalitis).
 - The "incubation period" (time between infection and onset of clinical symptoms) of rabies varies widely between days and several years but is mostly between 1 and 6 months. This is important because "post-exposure vaccination" is highly effective (almost 100%) in rabies, but only if performed before clinical symptoms appear. Once symptoms of rabies appear vaccination is no longer effective and the outcome is fatal in almost 100% of cases. <http://www.who.int/csr/don/2009/07/09-rabies>
 - How to prevent rabies?**
 - Stay away and do not touch any dogs, "fame" wild animals (e.g. lemurs, monkeys) or even domestic animals which might have not been vaccinated and, especially when handling them, might recently have been infected by wild or stray animals. Even if the behavior of an animal appears to be normal this does not rule out rabies infection. Do not touch dead animals. Children should be watched with extra vigilance! The only way to prevent human side of rabies is by vaccination.
- TropNet**
 - European Network for Tropical Medicine and Travel Health

The flyer also includes a small image of a bat and a logo for TropNet. At the bottom, there are three numbered pages of text in multiple languages (English, French, German) providing detailed instructions for rabies prevention and vaccination.

Volunteers needed: developing, translating... group-work !

Post-Artesunate Non parasitemic Deferred Anemia (PANDA) is related to pitting

ABSTRACT

Background: After being cured by artesunate, severe malaria patients sometimes experience a delayed anemic episode called Post-Artesunate Non-parasitemic Deferred Anemia (PANDA). PANDA does not jeopardize the life-saving effect of artesunate, but may impair its worldwide deployment and complicates patient management. Its mechanism is unclear. Artesunate induces pitting, a spleen-specific process whereby drug-exposed parasites are expelled from their host erythrocytes. These once-infected erythrocytes then return to the circulation.

Methods: We could follow 78 *Plasmodium falciparum*-infected travelers for more than 8 days post-treatment with intravenous artesunate for severe malaria. Sixty three of these patients did not receive transfusion, allowing a robust interpretation of hematological findings. In this group, 13 (20.6%) had PANDA, as indicated by a greater than 10% drop in hemoglobin or rise in LDH concentrations occurring after

D8. The kinetics of once-infected erythrocytes and their morphology in the peripheral blood was determined in 16 and 4 patients, respectively.

Results: In patients with PANDA, concentrations of hemoglobin and once-infected erythrocytes dropped simultaneously. Once-infected erythrocytes had an 8.9% reduction in their projected area, possibly explaining their shorter life span. Compared to patients with other patterns of post-artesunate anemia, PANDA patients were more frequently hyperparasitemic (41% v 92%, $p < 0.017$). During the first week post-treatment initiation, the concentration of once-infected erythrocytes was higher than 0.18 Giga/L in 94% (14 of 15) and 23% (3 of 13) of samples from patients with PANDA or other patterns of anemia, respectively.

Conclusion: Typical delayed episodes of post-artesunate anemia were related to the deferred loss of once-infected erythrocytes, a completely original mechanism of post-infectious anemia. The early quantification of once-infected erythrocytes may serve as a predictive marker.

PANDA and the pitting debt

Post Artesunate Non-parasitemic deferred Anemia (PANDA)

- No classical etiologies for late anemia
 - DAT, enzymopathy, hemoglobinopathy
- Probably other mechanism
- Only patient on AS
 - But not all (15% ?)
 - Cured patient: no more parasitic infection
- → Post Artesunate Non-parasitemic Deferred Anemia (PANDA)

« Pitting » in vivo from patients treated for severe malaria by AS in France (unpublished data)

Case definition

Price *et al.* JID. 2001
 Zoller *et al.* EID. 2011
 Buffet *et al.* MMV. 2013

French patient name program survey 2011-2013

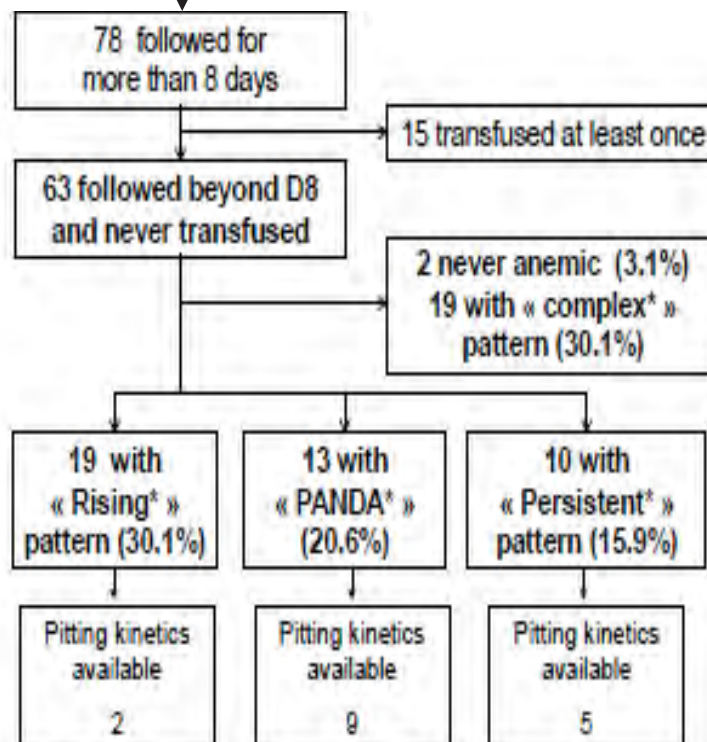

Figure 2: Anemia patterns

Figure 2: Anemia patterns

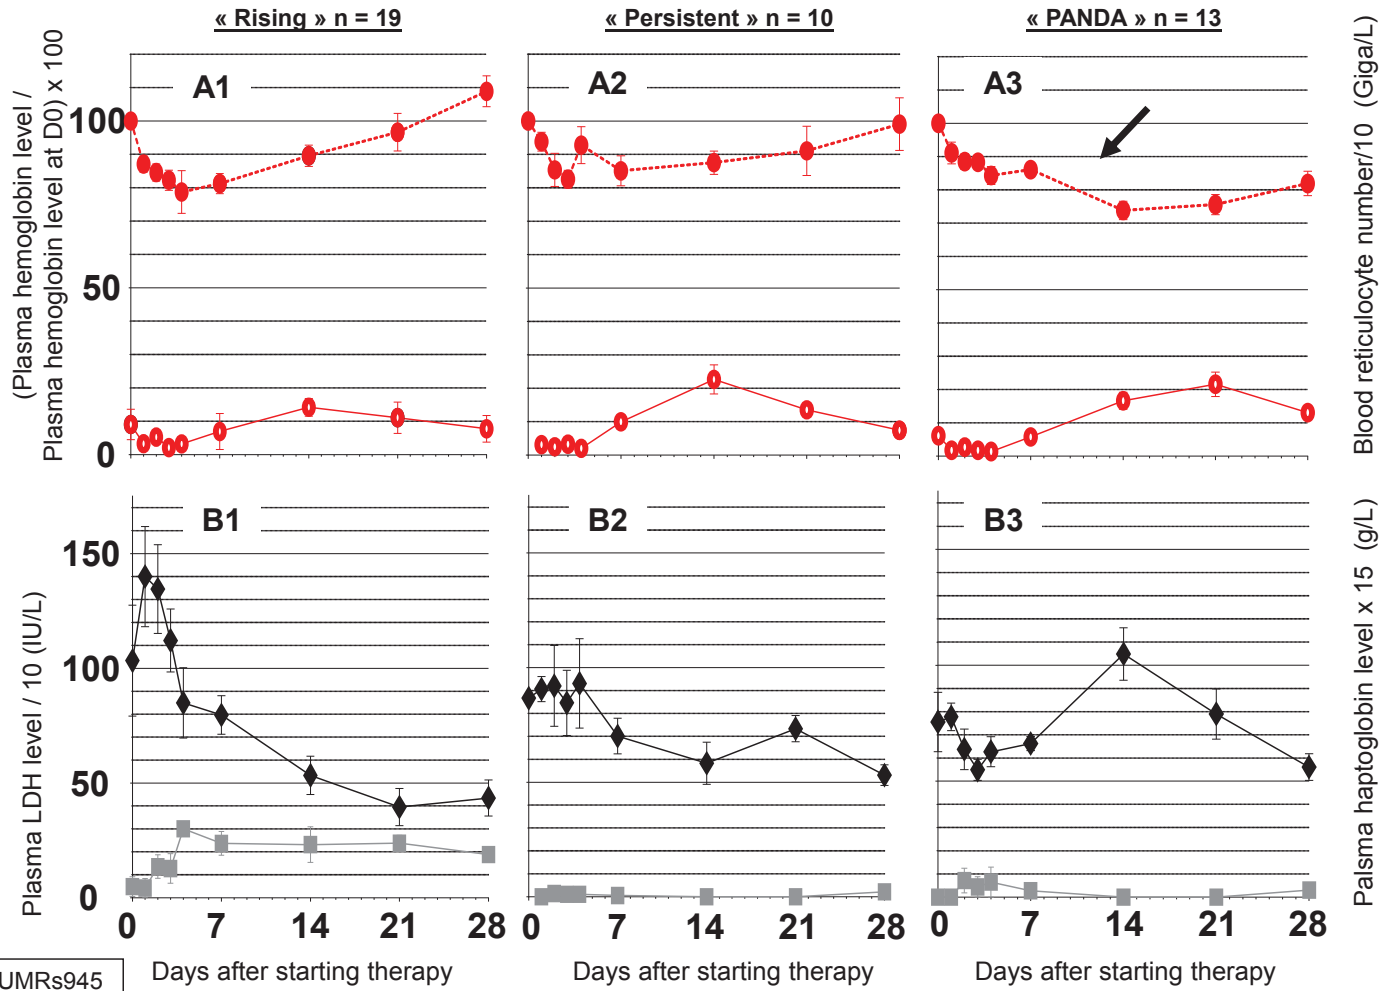

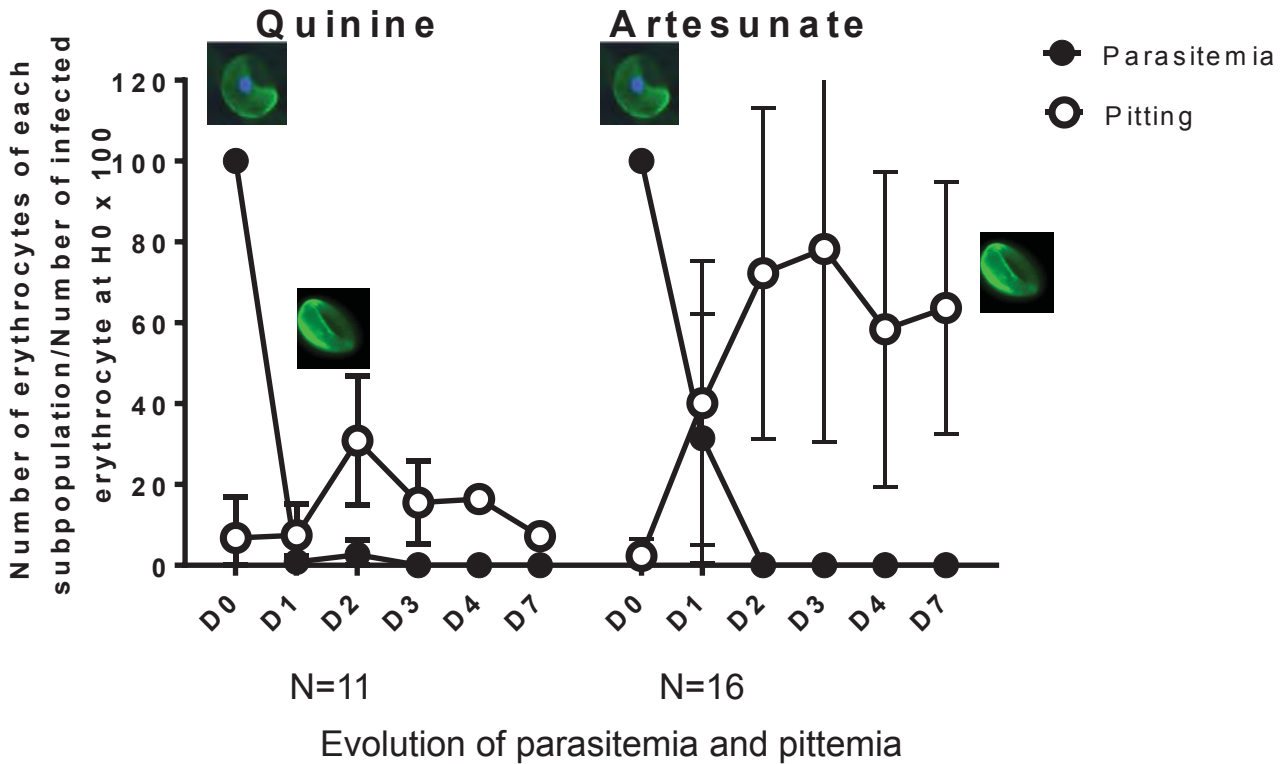

Figure 2: Anemia patterns

UMRs945

→ Pitting is the main factor for parasitic clearance under AS
→ Pitting rate is highly variable

UMRs945

Patterns of post artesunate anemia

UMRs945

Patterns of post artesunate anemia

First week concentration OIRBC

Patterns of post artesunate anemia

UMRs945

Frame work for risk of PANDA

Discussion

- Confirmed, insight, classification

Zoller *et al.* EID. 2011
Kreeftmeijer *et al.* Malar J. 2012
Rolling *et al.* Malar J. 2013

- **PANDA**

- More OIRBC during the first week:
 - Good predictive factor for the risk of hemolysis BUT maybe not the sole
- RBC surface loss: 8.9%
 - 17% threshold for retention
- Not in every patient because:
 - $(Pi) \times (PittingRate) = Nb Pc \rightarrow$ risk factor for PANDA

Safeukui *et al.* PlosOne. 2013

- Solely AS not Q

→ « Debt to pay »

- Infected RBC initially sparing at the beginning will be lost later
- Cost price for survival

Questions ? Limits ?

- « Persistent pattern »

- Overlap or transition form between Rising and PANDA pattern
- Persisting hemolysis is already described:
 - Extra vascular hemolysis for uninfected RBC decorated by *P. falciparum* proteins
- Not exclusive

Awah *et al.* Parasite Immunol. 2011
Woodruff *et al.* Lancet. 1979

- Size!

- Loss is explain in part by the loss of OIRBC
- Pi is near to the loss of hemoglobin: 10-15%
- Findings seems to be robust but more pitting evaluation is needed

TropNet **artemisinin** drug safety studies

HAEMO-ART, SMPS & TOX-ART

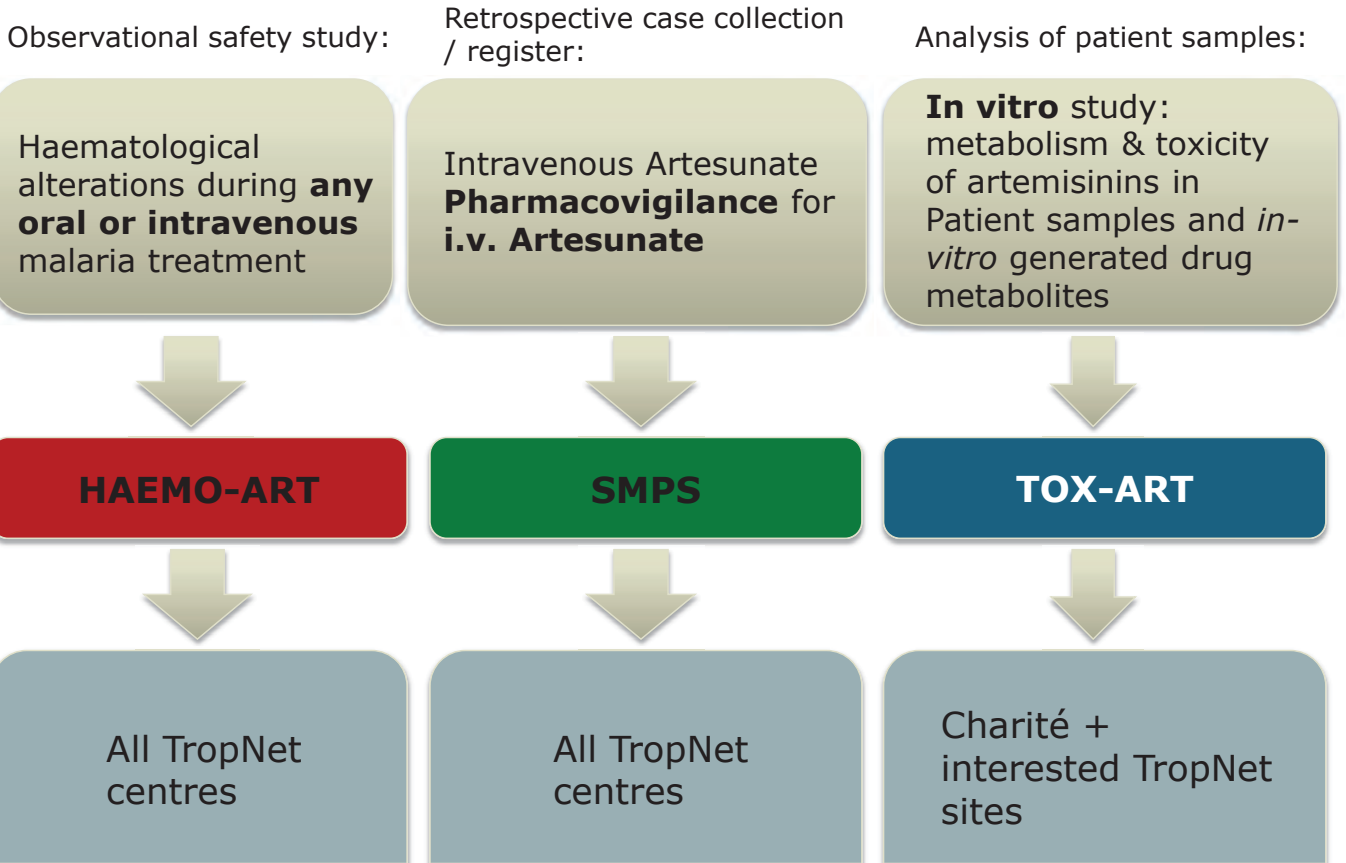

Florian Kurth, Andreas Neumayr &
Thomas Zoller

1

Timeline of artemisinin studies

- Prague **2012**: presentation of first concept of HAEMO-ART study
- **2013**: development of *in-vitro* studies to investigate artemisinin metabolism and immunohaematologic toxicity
- **September 2013**: outline of **artemisinin drug safety project**
- **October 2013**: submission for ethical review
- **December 2013**: project start at Charité and setting up of collaborating TropNet sites

2

3

TropNet **HaemoART** study:

Haemolysis and other haematological alterations after antimalarial treatment with artemisinins (and other drugs)

4

Background

- Intravenous artesunate causes a late haemolytic reaction in some patients
- Artemisinins cause other haematological abnormalities, e.g. neutropenia, reticulocytopenia...
- No study has systematically investigated haematologic adverse effects of artemisinins
- Clinical observations suggest that a – mostly sub-clinical – haemolysis may occur also in patients after oral artemisinin treatment

5

Rationale

The proposed study aims to evaluate systematically and prospectively haematological parameters under and after antimalarial therapy with a focus on artemisinin treatment

Study design

prospective, observational, multi-centre,
non-randomized, non-interventional,
controlled safety & tolerability study

6

Primary endpoint

occurrence of clinical or laboratory-diagnosed haemolysis not attributable to malaria in a period of 6 weeks after the 1st dose of antimalarial treatment.

Secondary endpoints

- occurrence of any adverse drug reactions
- degree of haemolysis in relation to risk factors
- duration of haemolysis
- clinical interventions as a consequence of haemolysis
- immunohaematologic parameters in patient samples
- Other haematologic parameters under / after treatment

7

Study Population:

Patients with **uncomplicated as well as severe malaria** who receive antimalarial treatment with either

- artemether-lumefantrine
- dihydroartemisinin-piperaquine
- atovaquone-proguanil
- mefloquine
- intravenous artesunate*
- intravenous quinine
- chloroquine
- chloroquine-proguanil

* Due to legal requirements, cases will be analysed separately and retrospectively

8

Inclusion criteria

- adult or paediatric patient with microscopically confirmed malaria (*any species*)
- patient or legal guardian able to provide informed consent
- patient able and willing to complete follow-up examinations at least until **Day 21**

Exclusion criteria:

- Any drug or condition inducing haemolysis (details in protocol)

9

Definition of post-treatment haemolysis

any

- **unexplained increase of LDH** and/or
- **elevation of LDH above normal values for ≥ 7 days after parasitological cure**

within a period of 6 weeks after the 1st dose of antiparasitic treatment

(in addition other clinical and laboratory parameters may be considered to define a case of post-treatment haemolysis)

10

Visit schedule (example as in Germany)

In-patient	Visit 1	Day 0	<i>before first dose of treatment is given:</i> - inclusion and exclusion criteria, informed consent - patient questionnaire - vital status, clinical examination, baseline blood sample
	Visit 2	Day 3	vital status, clinical examination, blood sample, urine sample
Regular Follow-up	Visit 3	Day 7-11	vital status, clinical examination, blood sample, (optional: urine sample)
Study-Follow-up	Visit 4	Day 17-21	vital status, clinical examination, blood sample, (optional: urine sample)
	<p>Note: - <i>Visit 4 can take place either at the study centre or alternatively at a local GP with a reduced set of laboratory examinations: RBC, WBC & LDH</i> - <i>if signs of haemolysis are detected, the patient must be referred to the study centre for Visit 5</i></p> <p style="color: red;">→ If no signs of haemolysis, end of follow-up</p>		
Study-Follow-up	Visit 5	Day 27-31	vital status, clinical examination, blood sample, (optional: urine sample)

11

Data collected

Epidemiological information

- age
- sex
- ethnicity
- parasitological diagnosis
- non-antimalarial medication within 12 weeks prior to inclusion
- antimalarial chemoprophylaxis taken within 12 weeks prior to inclusion
- relevant co-morbidities
- travel destination

Antimalarial medication

- drug
- duration
- dose

Laboratory values (all patients at each visit):

- RBC (Hb, Hct), PLT, WBC
- LDH
- AST*
- Haptoglobine*
- Reticulocytes*
- bilirubin (total, conjugated)*
- Creatinine*
- potassium*
- CRP*
- blood film*
- G6PD (only 1st blood sample)
- Coomb's test* (6ml EDTA)
- parasitaemia*
- In selected study centres: blood sample for immunohaematol. & pharmacol. analysis (10ml serum + 6ml EDTA)

In case of haemolysis:

- haemoglobin electrophoresis
- serum & urine sample for further analysis

* these values are recommended, but **optional** when study visit takes place at local GP ¹²

Data collection

- patient data will be collected using an electronic *.pdf form and transmitted (encrypted) to the coordinating study site
- ethical clearance will be obtained at the Charité University Hospital, Berlin, Germany. Participating study sites are responsible for ethical review according to local regulations

13

Publication policy

- The coordinator will choose and agree with another author making essential contributions to the work on first/last authorship for each publication of study data
- Submission of at least 5 fully documented cases qualifies for co-authorship in all study publications. In publications where the number of authors is limited, co-authors will be selected according to the number of cases contributed
- Centres submitting less than 5 cases may qualify for co-authorship if they make other relevant contributions to the study, e.g. in data management or data analysis, manuscript preparation or proof-reading

14

SMPS

Severe malaria pharmacovigilance system

15

Outline

- Structured, retrospective pharmacovigilance reporting of own personal treatment data from patients having received at least one dose of **intravenous artesunate**
- The primary outcome is the occurrence of adverse drug reactions during or after treatment of severe malaria with **intravenous artesunate**

16

Design:

- No formal study (legal requirements)
- No formal registration or inclusion procedure
- Low-threshold for reporting: short eCRF, less than 10 minutes work
- Data transmission must be in accordance with local (ethical) rules and requirements, reporting physician is responsible

SMPS - Severe malaria pharmacovigilance system (artesunate case register)

eCRF
Study coordinator: Dr. Thomas Zoller - thomas.zoller@charite.de

3-digit Study Centre Code (e.g. BEC) Patient number (consecutive number per site)

Inclusion criteria
- Patient with severe malaria, as defined according to national/local criteria
- Patient must have received at least one dose of artesunate/artesunate
Exclusion criteria
None

Please tick if patient is also enrolled in HAEMO-ART study (you may then leave fields on this page blank, continue with "parasitological diagnosis" on next page.

Patient information Age Sex
Body weight Pregnancy Ethnicity

Relevant co-morbidities

Non-antimalarial medication within 12 weeks prior to inclusion

Malaria prophylaxis within 12 weeks prior to inclusion No Prophylaxis

Country where infection (most likely) was acquired

Presence of semi-immunity, as assessed by predominant place of residence in an African malaria-endemic country in the period of five years prior to inclusion: Pred. residence NON-malaria endemic-country

3. Antimalarial treatment* * If more than 1 or other drugs were used, please give details on last page of eCRF

Choice of antimalarial treatment	Start of 1st antimalarial medication = day 0	Last dose of medication on day
<input type="text"/>	<input type="text"/>	<input type="text"/>
<input type="text"/>	Last dose of medication on day	Last dose of medication on day
<input type="text"/>	Last dose of medication on day	Last dose of medication on day

Please tick if antimalarial drugs were given in regular dose, if not specify in next field -> Specify dosage:

17

TOX ART

***In vitro* Study on the toxicity and haemolytic potential of Artemisinin metabolites**

18

Outline

- in vitro metabolism of Artemisinins on isolated hepatocytes and identification of metabolites with haemolytic potential
- qualitative and quantitative analysis of Artemisinin metabolites and (immuno-)haematological parameters in serum samples from selected patients from the Haemo-ART or patients having received intravenous artesunate
- Interested TropNet centres may cooperate with providing patient samples of patients with haemolysis, equipment or methodology

Sigma-Tau & TropNet study:

Proof of concept study of Eurartesim[®] in patients with imported uncomplicated *P. vivax* malaria

1

Study outline

- Study sites:** multicentre study within the TropNet network
(sites with a considerable number of *P. vivax* cases in Italy, Spain, France, Germany, Switzerland, The Netherlands, Israel)
- Study subjects:** 100 adult patients (18 - 65 years old), male & female, affected by uncomplicated *P. vivax* malaria
- Setting:** patients may be followed up as in- or out-patients
- Timeframe:** study recruitment period: 16 months (starting Oct. 2013)
each patient will remain in the study for 42 days:
D1, D2, D3 – D7 – D21 – D42

2

Study objectives

Primary objective: uncorrected adequate clinical and parasitological response (ACPR) at Day 21

Secondary objectives:

- Proportion of aparasitemic patients (at different visits)
- Proportion of afebrile patients (at different visits)
- Uncorrected adequate clinical and parasitological response at Day 42
- Proportion of patients with treatment failure

Safety & tolerability of the drug:

- Adverse events occurrence
- Change in haematology, blood chemistry, vital signs and ECG

Harmonization of clinical management & diagnostic methods for cutaneous & mucosal leishmaniasis in Europe

- **Improving treatment based on molecular species differentiation**
- **Harmonizing the molecular diagnostic methods** for rapid diagnosis and species determination
- **Harmonizing the therapeutic guidelines** for cutaneous and mucosal leishmaniasis in Europe

1

Current situation within Europe

- **Clinical management of CL & ML**
 - various treatment recommendations differentiating between Old and New World leishmania species are available
 - treatment recommendations are based on data from endemic regions
- **Species specific treatment**
 - species specific treatment recommendations are available
 - not evaluated in travelers
- **Genotyping of leishmania species**
 - done in many centers / widely available
 - no comparative evaluation / validation of the different methods

2

Objectives of collaborative project

- evaluation of the applied treatment protocols and outcomes with respect to the infecting parasite species
- comparison of all currently applied genotyping techniques
- obtaining genetic sequence information of all clinical isolates
- establishing a common data base of molecular and clinical data
- **long-term goal: standardization of species specific treatment protocols based on molecular species typing**

Selection of treatment regimen

- each centre is free to choose a treatment regimens based on state of the art knowledge / own experience
- species specific treatment recommendations have been compiled by the Leishman working group

Inclusion criteria

1. all patients with parasitologically confirmed cutaneous or mucosal leishmaniasis
2. clinical data **and** samples available
3. patient informed consent regarding the use of biopsy material and data

Exclusion criteria

- none
- pregnancy is not a criterion of exclusion, but treatment has to be adapted or postponed after delivery

The Leishman consortium

8 European countries, 17 institutions

Belgium (1 institution)

France (3 institutions)

Germany (1 institution)

06/2007 - 02/2008: Etanercept

02/2008 - 04/2009: Leflunomid 20 mg/d

02/2008 - 05/2008: Infliximab 5mg/kg/6 weeks

05/2008 - 10/2008: Infliximab 5mg/kg/4 weeks

Travel history:

2007: Egypt

2008: Mexico & Italy

Nov. 2008: consultation due to progressively disseminating cutaneous lesions since July

9

10

- species?
 - PCR: *L. infantum*
 - which investigations?
 - ENT examination normal, HIV negativ, no signs of VL
 - continuation of TNF- α antagonist?
 - discontinuation of all immunosuppressive drugs, analgesics for rheumatoid arthritis
 - which treatment?
 - meglumine antimoniate 20mg/kg/day i.m. for 28 days
- regression of all lesions / clinical cure
- restart of TNF- α antagonist and MTX in lower dosage
- no relapse (currently under surveillance since 4 years)

11

12

Cutaneous leishmaniasis in rheumatoid patients treated with TNF- α antagonists

- an increasing problem ?!
 - data currently limited to case reports
- we collected and summarized 16 cases: 8 cases from the **LeishMan working group** and 8 cases from the published literature:
- 15 CL & 1 ML
 - 10x *L. infantum complex*, 2x *L. aethiopica*,
4x *unknown species*

13

TNF- α antagonist therapy after diagnosis:

- discontinued: 7 cases
- temporarily discontinued: 3 cases
- continued: 5 cases

Outcome:

- **clinical cure achieved in all cases**
- 2 patients showed relapse after 1 and after 2 years.
- both relapses were clinically cured by retreatment without further relapses during a 1 year and a 2 years follow-up period

Antileishmanial treatment:

- 5x liposomal amphotericin B
- 4x miltefosine
- 2x systemic antimonials
- 5x local treatment with antimonials

14

Results

- the incubation period of CL in patients treated with TNF- α antagonists appears to be relatively long compared to non-immunosuppressed patients:
median 7.5 months (1-15 months) vs. 28 days (5-150 days)¹
- the median time interval between onset of CL lesions and diagnosis of CL appears to be identical to non-immunosuppressed patients:
4 months (1 mo.-7 y) vs. 3/4 mo. (3/19 d –5/24 mo.)^{1,2}
- the number and morphology/size of CL skin lesions in patients receiving TNF- α antagonists and in non-immunosuppressed CL patients appears to be similar:
 - **most patients present with 1-3 lesions** ²
 - **no differences in morphology or size of lesions** ²

¹ El Hajj L. et al. Int J Dermatol 2004;43:120e5.

² Harms G. et al. Emerg Infect Dis 2003;9:872e5.

- all reviewed leishmaniasis patients under TNF- α antagonist therapy were treated successfully.
we conclude that these patients can be treated by using the usual recommendations and guidelines
- should TNF- α antagonist therapy be discontinued during or after anti-leishmanial treatment ?
currently no data from prospective studies available, but continuation appears to be possible
→ suggestion:
 - **discontinuation of TNF- α antagonist therapy during anti-leishmanial treatment**
 - **after complete resolution of the skin lesions TNF- α antagonist therapy might be restarted with the smallest needed dosage under close clinical monitoring**

Research projects in a European context

Discussion on perspectives of
efficient joint research projects

Matthieu MECHAIN

Tropical and Travel Medicine Assistant Physician

Public Health and Social Medicine Specialist

Biology, Epidemiology, Health Law Background

Lateral thinking anecdote

- It's the story of a traveler who owes money to a money lender.
- As they were standing on a stone strewn path full of white and black stones, the traveler agrees to settle the debt based upon the choice of two stones (one black, one white) from a money bag.
- If his daughter chooses the white stone, the debt is canceled; if she picks the black stone, the moneylender gets the traveler's daughter.
- If the daughter doesn't choose a stone, her father would be thrown into jail.
- However, the moneylender "fixes" the outcome by putting two black stones in the bag.
- But the daughter sees this.

Ideas?

- What could be the solution for the debt being canceled?
- What would *you* recommend that the girl do?

Solution

- When she picks a stone out of the bag, she immediately drops it onto the path full of other white and black stones.
- She then points out that the stone she picked must have been the opposite color of the one remaining in the bag.
- Unwilling to be unveiled as dishonest, the moneylender must agree and cancel the debt.
- The daughter has solved an intractable problem through the use of lateral thinking.

Creativity

- To get a different perspective on a problem, try breaking the elements up and recombining them in a different way (perhaps randomly).

European research context

- European legal context is complex
 - No a unique European procedure
 - No homogenous rules - depending on the type of research project
 - Constraint of legal and administrative burdensome (bureaucracy)
- Opportunity - Creativity
 - Facing Health and Climate change issues
 - Horizon 2020

From networking to institutional links

- What do you think about establishing a consortium group with institutional links based on our network?
- Why this proposal?
 - Confidence for the decision makers and funders
 - Feasibility for project reviewers
 - Simplicity in anticipating administrative issues and having specific guidance
 - Efficiency of joint ambitious European research projects

How to face this challenge

- We need a small group of 2 or 3 institutions to prepare a common conventional document
- To anticipate difficulties at a European level and make a proposal to other interested institutions
- To face this challenge we need a strong adhesion to this proposal

Thank you for your attention

Discussion on perspectives of efficient joint
research projects
